Why am I Learning, What I am Learning

B.Tech. II Year II Semester - **CSE** and **C**

Subject Name: SOFTWARE ENGINEERING

Academic Year: 2025-26

Roll.No	Name	Course
24071A05F3	G. Hemanth	SOFTWARE ENGINEERING
24071A05F9	K. Srivatsav Reddy	
24071A05G2	K. Siddhartha	
24071A05H0	K. Srishanth Reddy	
What did you learn from this course? (Note:This should not reflect the syllabus of the units)		
In this unit, we learned how to identify, analyze, and manage risks that may arise during software development. We understood that risks are unavoidable in any project, but proper planning and proactive strategies can reduce their impact. We studied how risks can be related to technical issues, project delays, cost overruns, or changing requirements, and how early identification helps in better control. We also learned the difference between reactive and proactive approaches to risk management. A proactive approach focuses on anticipating risks in advance and preparing solutions, while a reactive approach deals with problems after they occur. This helped us understand the importance of planning and preventive measures in software projects. In addition, we gained knowledge about quality management, which ensures that the software meets required standards and user expectations. We studied concepts such as software quality assurance, formal technical reviews, and adherence to standards. These practices help in maintaining consistency, reliability, and overall system quality. Overall, this unit enhanced our ability to handle uncertainties, improve software reliability, and ensure that high-quality products are delivered throughout the development lifecycle.		
Was the application illustrated, clear for understanding the topics covered in this course. (Explain in few words)		
Yes. The application-based approach made it easier to understand how risks and quality issues arise in real software systems and how they can be managed effectively. It clearly showed how proactive planning and quality assurance practices improve system reliability and performance.		

Identify an application, to relate to the content learnt and explain.

Application Example: Cloud Kitchen / Online Food Delivery System

- **Risk Identification:**
In the cloud kitchen system, risks may include server failures, payment issues, incorrect order processing, or delays in delivery. Identifying these risks early helps in planning preventive measures.
- **Risk Management Strategies:**
A proactive approach involves implementing backup systems, secure payment gateways, and proper error handling. A reactive approach handles issues such as fixing bugs or resolving system failures after they occur.
- **RMMM Plan (Risk Mitigation, Monitoring, Management):**
The system continuously monitors performance, mitigates risks through updates and testing, and manages issues efficiently to ensure smooth operation.
- **Quality Management:**
Quality assurance ensures that the application functions correctly, provides accurate results, and offers a smooth user experience. Regular testing, reviews, and adherence to standards improve system quality.
- **Standards & Reviews:**
Following quality standards and conducting technical reviews ensures that the system remains reliable, secure, and maintainable over time.

Clarifications/Suggestions (If any):

None
